INTRODUCTION

- The COVID-19 pandemic greatly impacted the oral health workforce, dramatically affecting their ability to deliver oral health services
- After closure in March 2020, about 99% of dental offices were re-opened by July 2020, with 90% of offices at pre-pandemic staffing levels
- Yet, a study of patients showed that only 23% of respondents had visited a dentist in the past year during the pandemic
- Analysis of recent trends shows a steady decrease in utilization of oral health services among adults across all socioeconomic strata, with cost being the most reported reason for the decline
- Research objective: To assess how the pandemic affected oral health status and utilization of oral health services and highlight unique factors that disproportionately affected vulnerable and underserved populations

METHODS

- Data Source: OHWRC researchers developed a series of questions pertaining to need for, use of, and barriers to receiving oral health care for adults during the COVID-19 pandemic
- These questions were included in the Consumer Survey of Health Care Access, which was fielded by the Health Workforce Research Center at the Association of American Medical Colleges (AAMC) in December 2020 and June 2021
- Online survey was conducted using a national panel of ~1.5 million adults
- Analytic study sample included 3,505 adults aged 18 years and older who reported a need for oral health services in the past year
- This project builds on our previous research that used consumer survey data to evaluate the facilitators and barriers to access to oral health services in 2017-2018

Statistical Analyses

- Descriptive statistical analyses, including frequency distribution, cross tabulation, and chi-square test were used to estimate associations between study respondents’ access to oral health services and their characteristics
- Survey data were weighted by age, gender, race/ethnicity, employment status, household income, educational attainment, and geographic region to better represent the characteristics of the US adult population as measured by the US Census Bureau
- All analyses were conducted in SAS v9.4

RESULTS

518-402-0250
info@oralhealthworkforce.org
www.oralhealthworkforce.org

- 46.6% of respondents always received dental care as needed, while 33.5% only sometimes received care and 19.9% did not receive any care
- Younger and underrepresented minority respondents were more likely to report not getting any needed dental care (P < .001)

Figure 1. Respondents Who Did Not Get Dental Care in the Last Year by Demographics

Figure 2. Respondents Who Did Not Get Dental Care in the Last Year by Socioeconomic Characteristics

- Respondents with lower education attainment, lower incomes, and those who were unemployed were more likely to not get care (P < .001)

- Associations of sociodemographic factors with access to dental care suggest that efforts to link underserved populations to oral health services remain important policy initiatives to reduce oral health disparities during the pandemic
- Identification of concerns about financial implications of the pandemic as well as difficulties related to dental cost, insurance status, and provider availability suggest that COVID-19 disproportionally affected the most vulnerable populations groups
- Current efforts to mediate financial and structural barriers should be amplified in order to improve access to dental care and overall health

ACKNOWLEDGEMENTS

The authors wish to acknowledge the contributions of the Association of American Medical Colleges (AAMC) and the Association of American Dental Colleges (AADC). We especially thank Michael SX, Director of Workforce Studies, and Natalie Hildreth, Senior Research Analyst, for their input on survey design and conduct. Their expertise is greatly appreciated.

The OHWRC is supported by the Health Resources and Services Administration (HRSA) of the US Department of Health and Human Services (HHS) as part of an award totaling $449,917 with 50% financed with non-governmental sources. IMPLICATIONS

- Respondents who identified access difficulties (ie, dental cost, insurance status, provider availability) were more likely to report not getting any needed dental care (P < .001)

Figure 4. Respondents Who Did Not Get Dental Care in the Last Year by Barriers to Care

- Respondents who reported high (21.7%) or medium (24.5%) level of concern about not being able to access a nearby dentist were more likely to report not getting any needed dental care (P < .001)

Figure 5. Respondents Who Did Not Get Dental Care in the Last Year by Pandemic Concerns

- 85.5% of respondents who reported high concern about not being able to access a nearby dentist were more likely to report not getting any needed dental care (P < .001)

- Having access to child care, the need for the respondents to work (full or part-time), a decrease in household income, and need for the respondents to visit a dentist regularly were more likely to report not getting any needed dental care (P < .001)

- 80.1% of respondents who reported high concern about not being able to access a nearby dentist were more likely to report not getting any needed dental care (P < .001)
